Late last fall the ESAT lab did several water analyses for metals.

The main data package was identified as TDF No. DG-216.

The data is being used as documentation for a Hazard Rank Package score calculation and the package reviewers in Washington have some issues with the data presentation.

1. Could you please tell me what the ESAT laboratory Quantitation Limits are for ICP-MS and ICP-AES in water. Are they the same as the CLP? I will need a document or memo/email to use as a reference for the document record.
2. The cover document and Form I like documents for the dissolved aqueous for each sample data group state that the analysis is for total metals. Could the cover sheet be re-written to state that the analysis was for dissolved metals. I know that the analysis is always for total metals (filtered or unfiltered), but it seems that lawyers cannot grasp that fine of a nuance.

Thanks
